Pictures from the San Jacinto cap at noon on Sunday 8/27/17.

The San Jacinto River gauge at Sheldon, about 6 miles north of the site, was 12.5-ft (normal 1 – 2-ft) at the that time of the pictures; the current stage is 20.75-ft, or about 8-ft higher than at the time of the pictures, so expect all of the berms to be completely underwater now. The river is currently rising about ¼-ft per hour.

The pictures below show water covering most of the cap, with some of the berms already underwater & others only a foot or so above the water.
